Strategies for Classroom and Clinical Teaching that Support the QSEN Competencies

Gerry Altmiller, EdD, APRN, ACNS-BC
Presenter has no conflict of interest
QSEN Competencies

• Health professions education: A bridge to quality (2003)
  - IOM; now National Academy of Medicine

• QSEN
  - Funded by Robert Wood Johnson Foundation
  - Focused on transforming basic education for nurses
  - Reflects a new identity for nurses that demonstrates knowledge, skills, and attitudes that emphasize quality and safety in patient care

• Relevance to Nursing Education and Clinical Practice
  - Pre-licensure Education
  - Baccalaureate Essentials /Master’s Essentials
  - Transition to Practice Program
2037 surveys completed

Greatest integration in Fundamentals and Med-surg courses
  - Least: Research, Public Health courses

Most integrated-Safety, patient-centered care, evidence-based practice
  - Least: Quality improvement, Informatics

Faculty reported needs:
  - Resources and ideas
  - Continuing education, faculty development workshops
  - Administrative support, time, collegial support
## The QSEN Opportunity

Current Language that aligns with practice

QSEN aligns with The Joint Commission and Magnet® Standards
Objectives

• Identify knowledge, skills, and attitudes that emphasize the QSEN competencies.

• Demonstrate strategies that can be integrated into classroom or clinical teaching to support behaviors consistent with the QSEN competencies.

• Discuss resources to support educational strategies aimed at quality improvement, patient safety, and systems effectiveness to promote student learning in classroom and clinical teaching.
Patient-centered Care

Patient is in control and a full partner; care is based on respect for patient’s preferences, values, and needs.

(Offer more control, choice, self-efficacy, individualization of care)

- Value added nursing care (rounding)
- Non-value added nursing care (waiting for assistance, delays, looking for supplies)
- Necessary but non-value added nursing care (medication preparation, documentation)
Patient-centered Care

Don Berwick: What is Patient Centered Care?
Patient-centered Care

- Medication Reconciliation

Medication Reconciliation Exercise

I. Extracting a Medication List
Bob is a 55-year old business man in the Emergency Room for complaints of shortness of breath, headache, & generalized pitting edema. Bob was recently diagnosed with congestive heart failure. His current vital signs are: HR 62, BP 115/85, RR 30, O$_2$ Sat 90%, Temp 98. He has no known drug allergies. He is awake, oriented and talkative, but only offers information if asked directly.
When asked about his medications, Bob states he takes a ‘water pill’ irregularly because of its effects during work. (He believes this medication begins with an L.) He also takes Digoxin, a blood pressure medication (Meta-something) prescribed years ago by another health care provider. He uses an inhaler (which he shows to you and you see it is Albuterol) & takes a multi-vitamin.
Medication Reconciliation Exercise

• At this point, what are you worried about in planning care for Bob?
• What other information do you need?
• What questions would you ask Bob to obtain this information?
Following further discussion with Bob, he reluctantly admits:

- He has Gout and takes colchicine.
- He drinks ‘occasionally’ (1 drink at lunch, 2 after work, and 1 before bed.) Last drink was last night around 9 pm
- He ‘occasionally’ uses cocaine – last time 3 days ago.
- Last night he also took cialis he obtained from a friend. He experienced substernal chest pain during intercourse so he took Aspirin and Mylanta. Neither helped so he took a Nitroglycerin. He went to bed and awoke this am with a headache and shortness of breath.
Medication Reconciliation Exercise

• At this point, what are you worried about in planning care for Bob?
• What actions will you take as Bob’s nurse?
• Is there other information you still need?
• How will you obtain, communicate, and record this information?
Medication Reconciliation

What do we now know?

- Bob has 3 medication interactions & needs education
- Metoprolol, Nitroglycerin & Cialis together ↓ BP
- Magnesium in Mylanta inactivates effects of Digoxin
- Aspirin & colchicine bind together preventing uric acid from being excreted by the kidneys
- Taking Lasix inconsistently affects recidivism (relapse)
- Patient education should include diagnosis & medical management, Medication actions/side effects, the importance of medication reconciliation with primary physician along with his role with patient safety
Medication Reconciliation

Exercise

As you reflect on Bob’s case, list all the potential errors providers could make if they did not know Bob’s story and have a list of Bob’s current medications.

Teamwork and Collaboration

Achieve quality patient outcomes by effectively communicating with nurses and inter-professional teams having mutual respect and shared decision making.

• Teams provide a safety net for individuals

An individual, no matter how professional or experienced, can never be as reliable as a team

Nance 2008
What does a healthy team look like?
Teamwork and Collaboration

Synergistic result of effective interdisciplinary collaboration

- System-based solutions for Safe hand-offs
- Acknowledging other team members contributions
- Ability to raise concerns; Assertion
  - CUS (concerned, uncomfortable, safety)
  - 2 challenge rule
  - Critical Language “I need some clarity.”
Teamwork and Collaboration

- Reframing Constructive Feedback
  - http://qsen.org/giving-and-receiving-constructive-feedback/

- Managing Challenging Communications
Focus of Constructive Feedback

Address faulty interpretations; Provide options for improvement

- **Most effective** when focused on
  - Task
  - Process
  - Self-regulation; error detection skills
  - Adds to knowledge base

- **Least effective** when focused on
  - Person him/herself
  - Doesn’t add to knowledge base

- Feedback whether positive or negative should always be an unbiased reflection of events
Evidence-based Practice

Integrate best current evidence, clinical expertise, and patient preferences and values to deliver optimal health care.

Reduce Variability through evidence Integration of Standards

“It’s less of a thing to do…and more of a way to be”

- Handwashing
- Proper hygiene for in and out of room
- Pressure ulcer prevention
- Ventilator associated pneumonia prevention
- Influenza/pneumococcal disease prevention
Evidence-based Practice

Translate new knowledge into evidence

- Identify those at risk for infection
  - Bundles and protocols
    - http://www.jointcommission.org/infection_control.aspx

- Activity: Group Work to Create Poster for Bundles
  - CAUTI
  - CLABSI
  - VAP
  - HAPIs
  - Falls
Monitor outcomes of care processes and use improvement methods to design and test changes to improve the health care system.

- **Culture of Safety-Just Culture**
  - Report errors/adverse events/near misses
  - Systematic Investigations of problems
  - Safe to ask for help
Quality Improvement

- **Student Assignment using Model for Improvement**
  - Improve something about themselves, their school.....

- **Presentation of data:**
  - Describe Aim
  - PDSA (Plan, make the change, how tested, how studied)
  - Use of Tools (flow charts, check sheets, run charts, bar graphs)

- **PDSA (Plan, Do, Study, Act)**
  - What are we trying to accomplish?
  - How will we know that a change is an improvement?
  - What changes can we make that will result in improvement?

Asking People to Wash Hands
Empowering Patients to Protect Themselves
Shannon Roleson
Class of 2018

Sufficient hand washing is of paramount importance to patient safety—yet, even today, up to 50% of health care professionals fail to follow the proper guidelines. However, there are simple changes that both hospitals and patients can implement to decrease this astronomical percentage, and improve patient safety. Patients commonly feel as though they would be insulting the education and authority of their providers, if they were to question them about hand washing. However, patients DO have the right to approach medical personnel, especially when it pertains to their safety or health. How can we help our patients do this? We can teach them to say, “Can you please wash your hands, for my safety?” Evidence shows that rephrasing the request to include the patient’s safety compels healthcare professionals to follow this procedure more closely.

A study at a North Carolina hospital, concluded that simply changing the phraseology of signs located at hand washing stations could positively improve rates of hand washing. When formulated to address patient safety (“Hand Hygiene Prevents Patients from Catching Diseases”) rather than personal safety (“Hand Hygiene Prevents You from Catching Diseases”), compliance rates notably increased. Simply changing one word can alter the mindset of staff, reminding them of the true importance of, and reason for, hand hygiene.

As just as patients need to be proactive members of their healthcare by asking professionals to wash their hands, nurses can do the same, asking for hand washing for the patient’s safety when they see another professional is not following proper protocol to wash hands. By encouraging patients to speak up, and arm them with a phrase they can rehearse and use if needed, we help them protect their personal safety, as well as that of health care providers and other patients. Simple actions, such as informing patients of how to make a request to the health care provider, can make all the difference in the health and safety of patients.

Advocating for Patients
Communication Strategies to Facilitate Safety
Paige Hammell
Class of 2018

In May of 2012, Today’s Hospitals published a story detailing the tragic death of a patient due to mere miscommunication amongst health care providers. A 37-year-old female was admitted to the ED at 9:00 pm with nausea, vomiting, and numbness. Her vital signs were assessed and she was ordered intravenous fluids. The nurse checked the patient’s blood pressure later in the night and found it had increased, but did not report it. Later, when the patient’s blood pressure continued to increase, the nurse reported it incorrectly. Because of this communication error, no actions were taken to address the patient’s condition. At 7:00 am, the patient was found lying on the floor. The patient was pronounced dead at 7:21 am of cardiac tamponade, caused by acute aortic dissection that had been developing over hours. This is not an isolated incident. According to The Joint Commission, 80% of serious medical errors are due to miscommunications. Many solutions have been proposed to reconcile the miscommunications, including issue-patient safety briefings, daily patient goal sheets, and face to face nurse shift reports. However, the most promising of solution seems to be implementing SBAR.

SBAR is an acronym for Situation-Background-Assessment-Recommendation. This is the most common tool used between healthcare providers. SBAR can be used in many clinical situations, such as conducting nurse-to-nurse shift reports. For example, the leaving nurse would report “Mr. Taylor in room 12 has just returned from an MRI (situation). He was admitted for severe abdominal pain (background). He just received pain medication and is reporting a pain level of 4 on a scale of 0-10 (assessment). He will need his vital signs checked and pain reassessed in 20 minutes (recommendation).” Patient hand-off, especially in the ED, can be chaotic, which makes a structured communication model vital; SBAR can help to prevent devastating communication errors.

SBAR improves the flow of information. When used as a consistently repeated pattern, errors become continued on page 2

Culture of Safety VS Culture of Blame: Fairness Algorithm

1. Did the individuals intend to cause harm?
2. Did they come to work drunk or impaired?
3. Did they do something they knew was unsafe?
4. Could two or three peers have made the same mistake in similar circumstances?
5. Do these individuals have a history of involvement in similar events?

- Applying the Fairness Algorithm
  - http://www.youtube.com/watch?v=8le7vYPUwaM
Dr. Jones is a cardiovascular surgeon. He wants to use a new renal artery device that is not yet supplied in the OR. He asks the sales rep to bring some tomorrow for his scheduled case. The next day, Jane, just off orientation, is the circulating nurse. She is asked where the stent is. Not knowing the plan, she is unable to answer and Dr. Jones insinuates she does not know her job.

Just as the case is beginning, the sales rep brings the stent to the OR. Feeling rushed and stressed, Jane opens the packaging and drops the stent into the sterile field and it is inserted. Following the surgery, the circulating nurse realizes the packaging indicates an expired date on the stent.

The stent delivery by the sales rep was not vetted through central supply. The patient is told about the error. Who is to blame?
The Lewis Blackman Story

Here are the 5 videos they are between 4 and 6 minutes long each.
